Eliminate WiMAX, RADAR and Other Sources of Interference at your C-Band Receive Antenna

- **Low Insertion Loss** – Typically less than 1 dB
- **Also Rejects Transmit Band (5800-6725 MHz) >70 dB Typ** – Eliminating the need for a separate TRF
- **Low Group Delay Variation** - 8 nS Max
- **Compact Size** – For easy installation on single or multi-feed LNBS
- **Superior VSWR Performance** - 1.5:1 Max
- **Quick Turnaround** – Most orders ship within (1-5) days ARO

Historically, the solution for eliminating out-of-band interference (e.g. - RADAR) has been to install a highly-selective bandpass filter. Specifically, a filter with a passband corresponding to that region's standard footprint (i.e. - 3700-4200 MHz, 3400-4200 MHz, etc.).

However, not long ago, WiMAX began operating in the (3400-3800) MHz frequency band in many regions around the world. This common band operation causes in-band interference at C-band receive sites that cannot be eliminated with "standard footprint" BPFs.

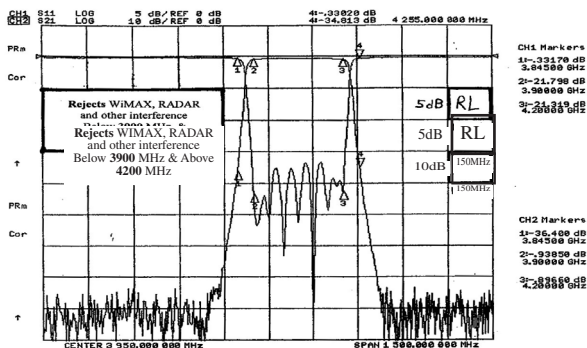

Example : WiMAX - operating at 3700 MHz - causes interference at a C-band receive site (where the footprint is 3700-4200 MHz). A standard footprint BPF will pass all frequencies from 3700 4200 MHz (i.e. - including the interfering WiMAX signal).

Solution : Install an MFC model 7893D-3780/4200 bandpass filter that will provide 30 dB rejection at 3700 MHz and will pass all remaining C-band from (3780-4200) MHz.

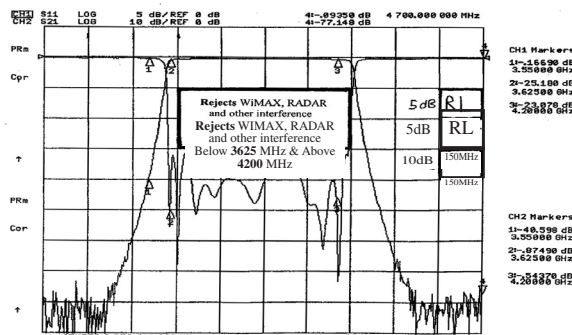

Following are just some of our many filtering solutions for eliminating WiMAX, RADAR and other C-band interference :

Model Number	Passband (MHz)	LOWER Rejection (Min./Typ. dB)	UPPER Rejection (Min./Typ. dB)
7893D-3400/4200	3400-4200	25/30 dB @ 3300 MHz	25/30 dB @ 4300 MHz
